

Periodic Table of Investment Returns

The Periodic Table of Investment Returns visually depicts annual returns for various asset classes, ranked from best to worst performing.

Risk and return characteristics of asset classes and styles can change in unpredictable ways. An asset class or style that was successful for the past ten years is no more likely than others to be successful in the next ten. Many complex factors determine what asset classes and styles will lead and lag in any given market cycle.

As seen in the table, some asset classes tend to have low or even negative correlation. That means when one goes up, the other goes down. Strategic diversification across asset classes, styles, geographic regions, and investment philosophies has historically been a successful way to mitigate risk and help control drawdown in bear markets as well as participate during bull markets. Diversification also helps avoid unnecessary concentration in any one asset class, style, stock, etc., which can have negative, long-lasting consequences.

How can you achieve diversification? One way is to utilize robust portfolio models that are carefully constructed to withstand and thrive in any market environment. A model can be chosen to address a range of risk tolerances, from conservative to aggressive. Our team can also work with you to create a personalized portfolio that addresses your unique needs or goals.
